

Reporting & Analytics

Data Requirements, Key Performance Indicators, and Feasibility Assessment

This document addresses the Reporting & Analytics requirement. For each of the four components, it sets out an overview of the requirement, the data required to support it, the key performance indicators it should surface, how the underlying data would be obtained, and an assessment of feasibility given TECU's current environment.

Summary

The following provides a high-level view of feasibility across the four components addressed in this document.

- Daily, weekly and monthly performance reports — Readily achievable; standard functionality of any modern contact center platform.
- Real-time dashboards — Achievable, but requires a dedicated live data connection rather than a standard scheduled refresh.
- Quality assurance reports — Feasibility depends on whether TECU has an existing quality assurance tool in place.
- Member sentiment reporting — Achievable where the selected platform includes AI/NLP capability; requires compliance review given the sensitivity of member data.

a. Daily, weekly and monthly performance reports

OVERVIEW

This requirement covers standard operational reporting: interaction volumes, handling times, and service-level performance, viewed across daily, weekly, and monthly reporting periods.

DATA REQUIRED

Interaction-level records capturing channel, timestamp, category, duration, and resolution outcome; staffing records comparing scheduled versus logged-in agents; and a standard date dimension to support rollups across reporting periods.

KEY KPIS

- Volume trend — interaction counts over time, segmented by channel and category.
- SLA compliance rate — percentage of interactions meeting response and resolution targets.
- Containment / First Contact Resolution (FCR) rate — percentage resolved without escalation or repeat contact.
- Average Handling Time (AHT) — average duration per interaction, bot versus agent.

HOW WE WOULD OBTAIN THE DATA

This data is generated natively by the contact center platform TECU selects. Modern platforms expose this through a reporting API or a native business intelligence connector, requiring no additional development.

Feasibility Assessment [High] This is standard functionality across virtually all current-generation contact center platforms and requires no custom development, provided TECU adopts. The principal risk lies in continued reliance on an older, on-premise phone system, which would necessitate manual reporting rather than an automated feed.

Illustrative sample data, for layout purposes only.

b. Real-time dashboards

OVERVIEW

This requirement provides live visibility into contact center operations — agent availability, queue depth, and wait times — updated continuously rather than on a periodic reporting cycle.

DATA REQUIRED

Live counts of agents online by channel, current queue depth, current average wait time, and the number of interactions in progress.

KEY KPIS

- Agents online — real-time staffing coverage.
- Queue depth — contacts currently waiting, an early indicator of service-level risk.
- Average wait time — live indicator of member experience.

HOW WE WOULD OBTAIN THE DATA

Through the contact center platform's real-time API or streaming interface — a standard feature for live operational visibility on modern platforms.

Feasibility Assessment [Medium] Achievable, though it requires a dedicated streaming or direct-query connection rather than a standard scheduled refresh, since Power BI's default refresh interval (fifteen to thirty minutes) does not meet real-time requirements. This should be scoped explicitly as part of implementation planning with the selected vendor, rather than assumed as a default inclusion.

Live Contact Center Status • refreshes every 30-60 sec

Illustrative sample data

Illustrative sample data, for layout purposes only.

c. Quality assurance reports

OVERVIEW

This requirement provides structured evaluation of interaction quality, confirming that agents follow required processes such as greeting protocol, identity verification, compliance disclosure, and resolution accuracy.

DATA REQUIRED

Records identifying which interactions were selected for review, evaluator scores against each checklist criterion, evaluator identity and review date, and a pass/fail compliance outcome — including designated criteria that constitute an automatic fail regardless of overall score.

KEY KPIS

- QA compliance rate — percentage of reviewed interactions meeting the compliance threshold.
- QA score by criterion — average performance on each checklist item, identifying coaching priorities.
- QA review coverage — proportion of interactions sampled, indicating the statistical reliability of the results.

HOW WE WOULD OBTAIN THE DATA

Certain contact center platforms include a native quality assurance module with API access to scores. Where this is unavailable, a dedicated QA tool would be required, or reporting would initially rely on manually compiled scorecards.

Feasibility Assessment [Depends] Dependent on TECU's current tooling. This is typically the least mature capability for organizations without an existing quality assurance platform. We recommend confirming with TECU directly whether a QA tool is already in place, or whether one should be included as part of the vendor deliverable.

Illustrative sample data, for layout purposes only.

d. Member sentiment reporting

OVERVIEW

This requirement uses automated analysis to determine member sentiment — positive, neutral, or negative — during an interaction, without requiring an explicit member survey.

DATA REQUIRED

A sentiment classification and confidence score per interaction, generated from voice or text transcripts, together with sentiment trends over time and breakdowns by channel, category, and agent.

KEY KPIS

- Sentiment score — proportion of interactions classified positive, neutral, or negative.
- Sentiment trend — rolling change in sentiment mix over time.
- Negative sentiment volume — count of interactions warranting follow-up attention.

HOW WE WOULD OBTAIN THE DATA

Most AI-enabled contact center platforms generate sentiment scores natively as part of transcript processing. Where this capability is not included, it can be added through a third-party natural language processing service.

Feasibility Assessment [Medium] Achievable where the selected platform includes this capability, subject to an important caveat: interaction transcripts frequently contain sensitive member financial information. Any use of third-party AI services for sentiment analysis should be reviewed and approved by TECU's compliance function prior to vendor selection, rather than treated as a purely technical decision.

All figures shown in the sample visuals above are illustrative and intended solely to demonstrate layout; production visuals will reflect live, connected data.

Illustrative Combined Report Layout

The following illustrates how the four components could be presented together on a single report page — headline KPIs at the top, supporting detail beneath. This represents a starting point for discussion, not a final design.

Key Terms

The following terms recur throughout this document and are defined here for reference.

Term	Definition
SLA	Service Level Agreement — the response/resolution time target. SLA compliance measures adherence to that target.
FCR	First Contact Resolution — resolving an issue in a single interaction, without a repeat contact.
AHT	Average Handling Time — the average duration of an interaction.
QA	Quality Assurance — structured human evaluation of whether agents followed the required process.
CSAT	Customer (Member) Satisfaction Score — a rating provided directly by the member following an interaction.
Sentiment	An automated determination of whether a member's tone during an interaction was positive, neutral, or negative.
Containment rate	The percentage of inquiries resolved by automation without human intervention.
Real-time data	Data that updates continuously, rather than on a standard fifteen- to thirty-minute refresh cycle.
